VOISShield.

Insights

How VOIS Shield turns phishing simulations, reports and training into a clear picture the business can act on.

A short guide for the GMT, leadership and administrators

Screens show the built-in sample organisation, not real employee data

Executive summary

Insights is the decision page of VOIS Shield. It brings every phishing simulation, every report from staff and every training record into one view. That view tells the business, in plain words, whether people are getting safer and where to act next.

Three questions, one page

01

Are we safer than before?

One risk score from 0 to 100, the programme's health, and the trend over one or two years.

02

Where is the risk?

Which departments, which kinds of phishing email (lures) and which people's habits carry the most risk.

03

What is working?

Whether training lowers clicks, which campaigns did well, and what changed since the last period.

A reading in one minute (sample organisation, last 30 days)

HEALTH	RISK SCORE	AT HIGH RISK	CLICKED · REPORTED	TRAINING
Protected	**18.1**	**1,764**	**14% • 32%**	**2.6×**
Twice as many reports as clicks, or more	Low risk · 20.5 a year ago	11.7% of 15,110 people	2.3 reports for every click	Less likely to click once trained

What each audience gets

GMT

A one-glance answer to "are we protected?", the direction of risk over time, and a report ready for the board or auditors.

Leadership and department heads

How their own department compares with the company, how many of their people are at high risk, and whether training is landing.

Administrators

Which lures fool which teams, how each campaign performed, and where to aim the next simulation and training.

Decisions it supports

- Where to focus training budget and time first
- Which departments need a leader's follow-up
- Which phishing themes to rehearse next
- Whether the programme is working
- How often to run campaigns, and for whom
- What to report upward, with an Excel export

HOW IT WORKS, IN SHORT

Insights reads three sources the platform already keeps: campaign results, each person's risk level, and training progress. It adds them up, compares each period with the one before, and shows the result by company, department, lure and campaign. Individuals are not named on the page, and no password or detail typed into a simulation is ever stored. Today the page runs on a built-in sample organisation; it reads live data as those connections are completed.

WHY

Numbers are not the same as answers

Phishing is still one of the most common ways attackers get in, and an awareness programme produces a lot of numbers: emails sent, links clicked, reports made, courses finished. On their own, those counts do not tell the business whether it is safer, or what to do next.

The gap Insights closes

BEFORE	WITH INSIGHTS
One report per campaign, read on its own	Every campaign in one view, compared with the period before
Raw counts: "412 people clicked"	Rates and a single 0–100 risk score that can be followed over time
No view by department or by kind of email	Risk by department, by lure, and by department and lure together
Training measured by completion only	Training measured by behaviour: do trained people click less?
Numbers without meaning	Every number has a sentence, and an ⓘ that explains how it is worked out

Four ideas behind the page

One score for the whole company

Each person has a risk level from their own phishing record. The levels are averaged into one score from 0 to 100, so leaders can follow a single line over time.

Behaviour, not attendance

What matters is what people do with a suspicious email. Insights sets reports against clicks: a healthy company reports far more than it clicks.

Always compared

Every figure is shown against something: the period before, a year ago, the company average or the other departments. A number alone rarely means much.

Facts first, decisions with people

Insights reports what happened, clearly and without advice. The decisions stay with the people who own them, and the next pages show how the facts lead there.

WHO

Three readers, one page

The same page serves three kinds of reader. Each starts at the top and goes as deep as they need: the top answers the GMT, the tabs answer leaders, and the profiles behind each chart answer administrators.

What each reader asks, and where to look

READER	QUESTIONS	WHERE TO LOOK	TYPICAL DECISIONS
GMT	Are we protected? Is risk going down? How do we compare with a year ago?	Health tile, risk score, Risk score over time, Export	Confirm the programme's direction and investment; set expectations; report to the board and auditors
Leadership and department heads	How does my area compare? How many of my people are at high risk? Is training working here?	Departments tab, a department's profile	Ask teams to finish training; follow up where risk rose; agree targets with the security team
Administrators (security awareness team)	Which lures fool people? Which campaign did well? Where should the next simulation go?	Lures & campaigns, Training, every profile	Plan the next campaigns and training; pick themes and audiences; fix programmes that lag

A simple rhythm

GMT · quarterly

Five minutes on the top of the page and the trend. Export the full report for the record.

Leaders · monthly

Their department's profile: its risk against the company, its people by risk level, and training.

Admins · after each campaign

The campaign's profile, the lure ranking and the department heatmap, then plan the next round.

GOING DEEPER

Almost everything on the page can be clicked. A department, a lure, a campaign or the risk score opens its own profile with more detail, and Back returns to where you were. People-level lists sit one step further, behind "See its people", and are shown only to those who have access to them.

WHAT

The top of the page answers "are we protected?"

The band at the top stays in place whichever tab is open. It holds the programme's health and four headline measures, each with its change against the period before.

The top band, shown in two halves: health, the period and the risk score; then the tabs, Export and three more measures.

1. **Health**
   Protected, Holding or Not protected, set by reports against clicks over the period. The emblem and colour change with it.

2. **Period**
   The last 30, 60 or 90 days. Every change shown is against the period of the same length just before.

3. **Risk score**
   The company's exposure from 0 to 100, with its level (low to critical) and the share who reported or clicked. The ⓘ explains it.

4. **People at high risk**
   How many people clicked more than once or gave details away, and their share of everyone.

5. **Hook Rate**
   The share of delivered simulation emails that were clicked. Lower is better.

6. **Report Rate**
   The share of delivered simulation emails that people reported. Higher is better.

7. **Tabs**
   Overview, Departments, Lures & campaigns and Training, each covered on the next pages.

8. **Export**
   The full report as an Excel workbook, or a short summary to paste into an email or slide.

READING A CHANGE

Each measure carries an arrow and an amount, for example ● 0.1 pts or ● 1.4 pts. Green means better and amber means worse, whichever way the number moved: a falling risk score is green, a rising Hook Rate is amber.

WHAT

The measures, in plain words

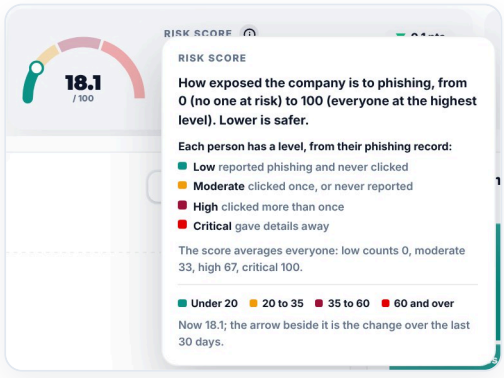

A small set of measures runs through every tab. They are worked out the same way everywhere, so a department, a lure and a campaign can be compared fairly.

MEASURE	WHAT IT TELLS YOU	HOW IT IS WORKED OUT
Health	Whether people report phishing faster than they fall for it	● Protected 2 or more reports per click · ● Holding at least 1 · ● Not protected fewer reports than clicks
Risk score	How exposed the company is, from 0 (no one at risk) to 100. Lower is safer	The average of everyone's level: low 0, moderate 33, high 67, critical 100
Risk level	Each person's standing, from their own phishing record	Low: reported, never clicked · Moderate: clicked once, or never reported · High: clicked more than once · Critical: gave details away
People at high risk	The group most likely to let an attacker in	People at the high or critical level
Hook Rate	How convincing the simulations were	Clicked ÷ emails delivered
Report Rate	How alert people are	Reported ÷ emails delivered
Reports per click	The balance between spotting and falling for phishing	Reported ÷ clicked. 2.3× means 23 reports for every 10 clicks
Gave details	How often a click turned into a real compromise	Entered details on the practice page. Only the fact is counted, never what was typed
Training impact	Whether training changes behaviour	Click rate of trained people against those not yet trained

Risk bands

The score falls in one of four bands, and the same colours are used wherever risk appears.

Low risk	Under 20
Moderate risk	20 to 35
High risk	35 to 60
Critical risk	60 and over

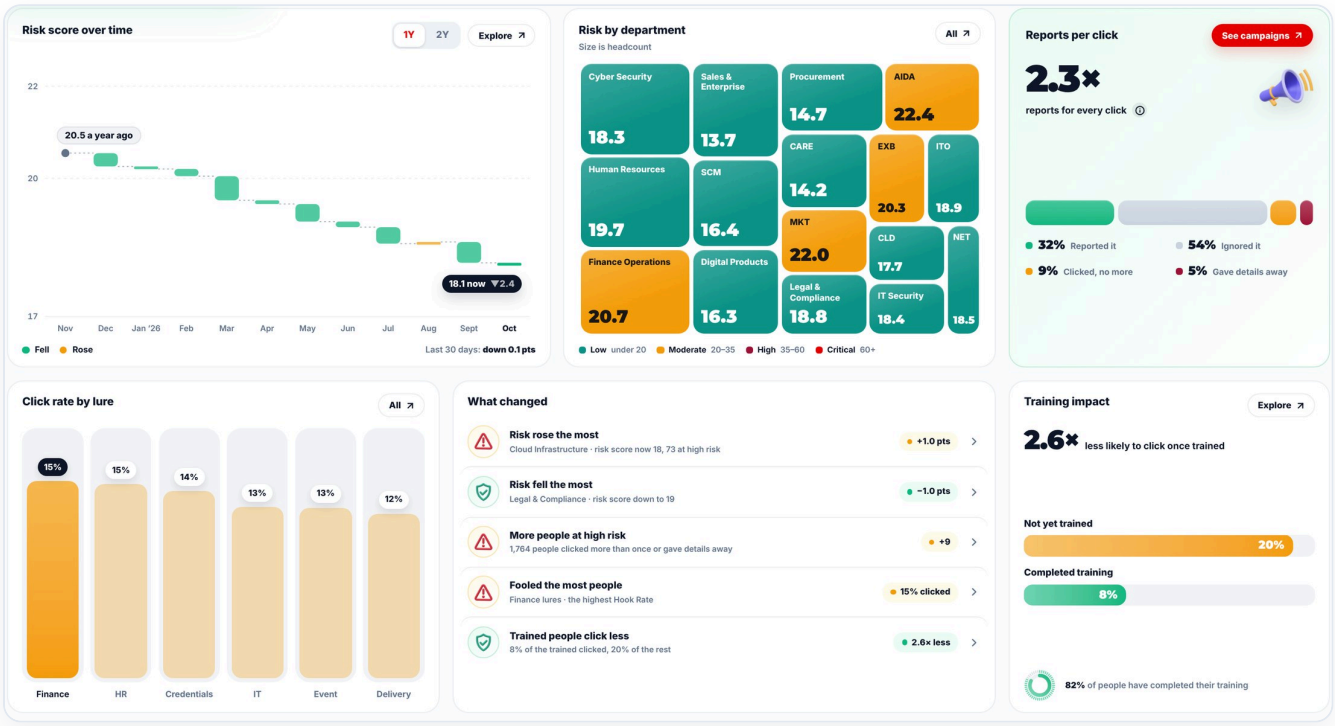

The ⓘ beside the risk score explains it on the page itself.

HOW IT HELPS

Overview: the whole programme on one screen

The Overview tab is the starting point for everyone. Six cards answer the three questions, and each one opens its detail.

Overview tab, sample organisation, last 30 days.

Risk score over time

The score month by month for the last one or two years. Green steps fell and amber steps rose; the label shows where it was a year ago.

Risk by department

Every department as a tile sized by headcount and coloured by its risk band, so large, risky areas stand out at once.

Reports per click

The programme's balance, and what people did with the emails: reported, ignored, clicked, or gave details away.

Click rate by lure

Which kinds of phishing email fooled the most people in the period.

What changed

The biggest movements since the last period: where risk rose or fell most, and the lure that fooled the most people.

Training impact

How much less likely trained people are to click, and how many have finished their training.

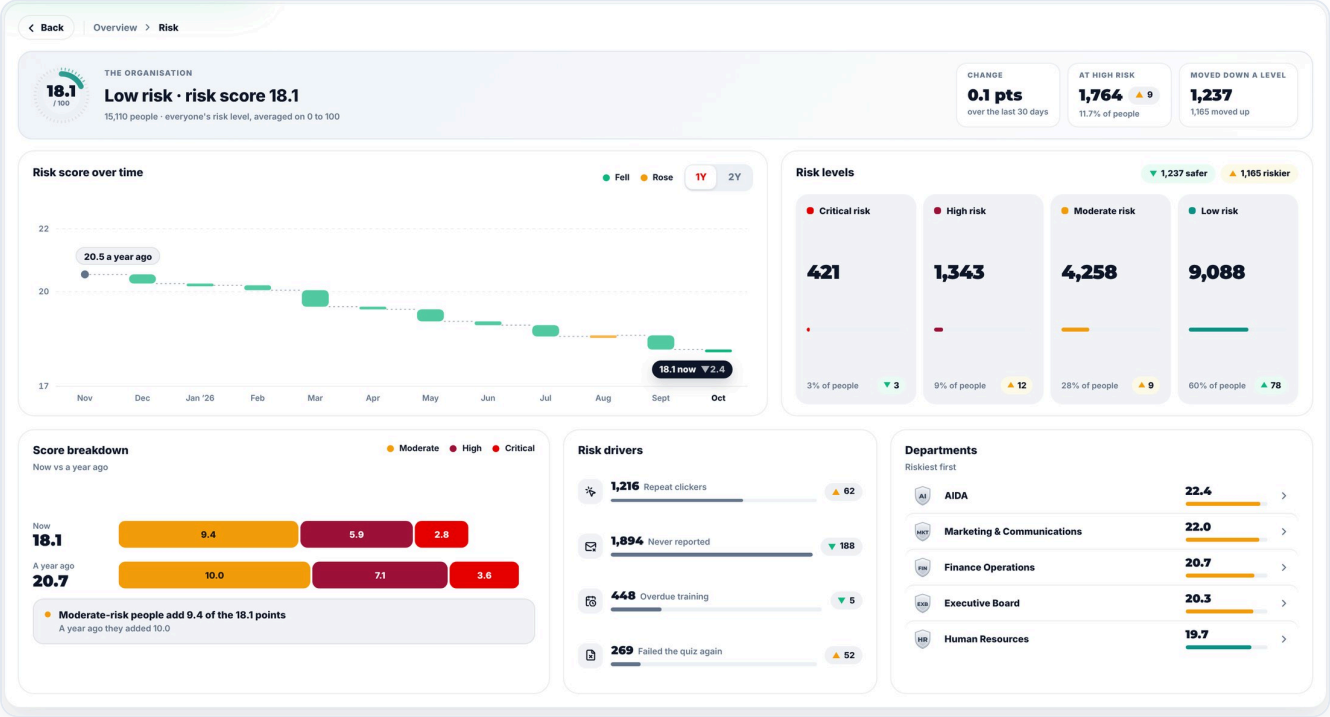

DECISIONS IT SUPPORTS

Whether the programme is on track (the trend), where to look first (the largest amber tiles and "What changed"), and whether to keep investing in training (training impact).

HOW IT HELPS

Behind the score: what drives risk

Clicking the risk score opens the company's risk profile. It shows where the score comes from, so leaders can see which behaviours, levels and departments move it.

The risk profile: the trend, the four risk levels, the score's breakdown, its drivers and the riskiest departments.

Risk levels

How many people sit at each level now, and how many moved to a safer or riskier level during the period.

Risk drivers

The habits behind the score: repeat clickers, people who never report, overdue training and failed quizzes.

Score breakdown

How many of the score's points come from moderate, high and critical people, now and a year ago.

Departments

Every department's risk score, riskiest first. Each opens its own profile.

DECISIONS IT SUPPORTS

Whether to target a behaviour (for example, coaching repeat clickers, or chasing overdue training) rather than everyone at once, and which departments' leaders to involve first.

HOW IT HELPS

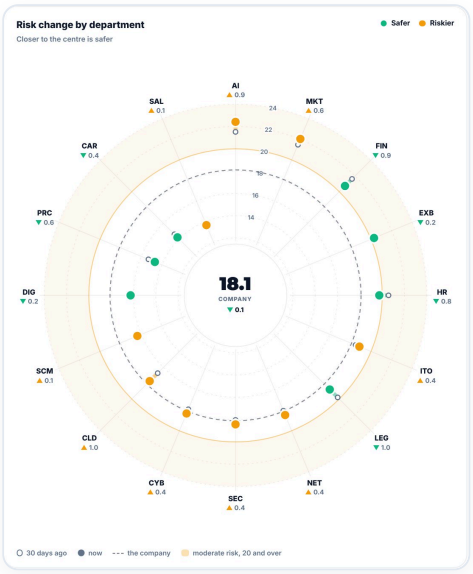

Departments: where the risk sits

Every department side by side: how each area compares, and where to aim.

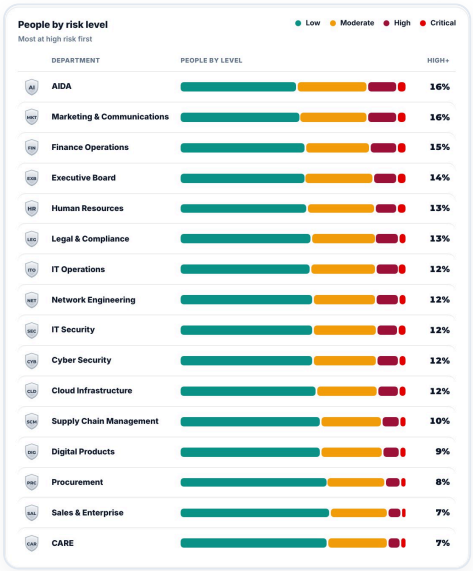

Reported vs clicked

Each department's report and click rates on one line, best first. Where the two dots meet, people click about as often as they report.

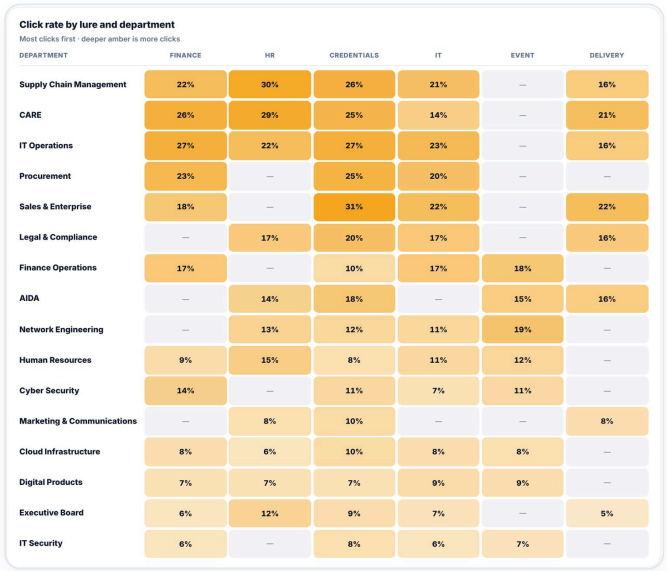

Risk change by department

Closer to the centre is safer. A dot moving out means the department became riskier.

People by risk level

Low, moderate, high and critical, most at high risk first.

Click rate by lure and department

Deeper amber is more clicks: which kind of email fools which team.

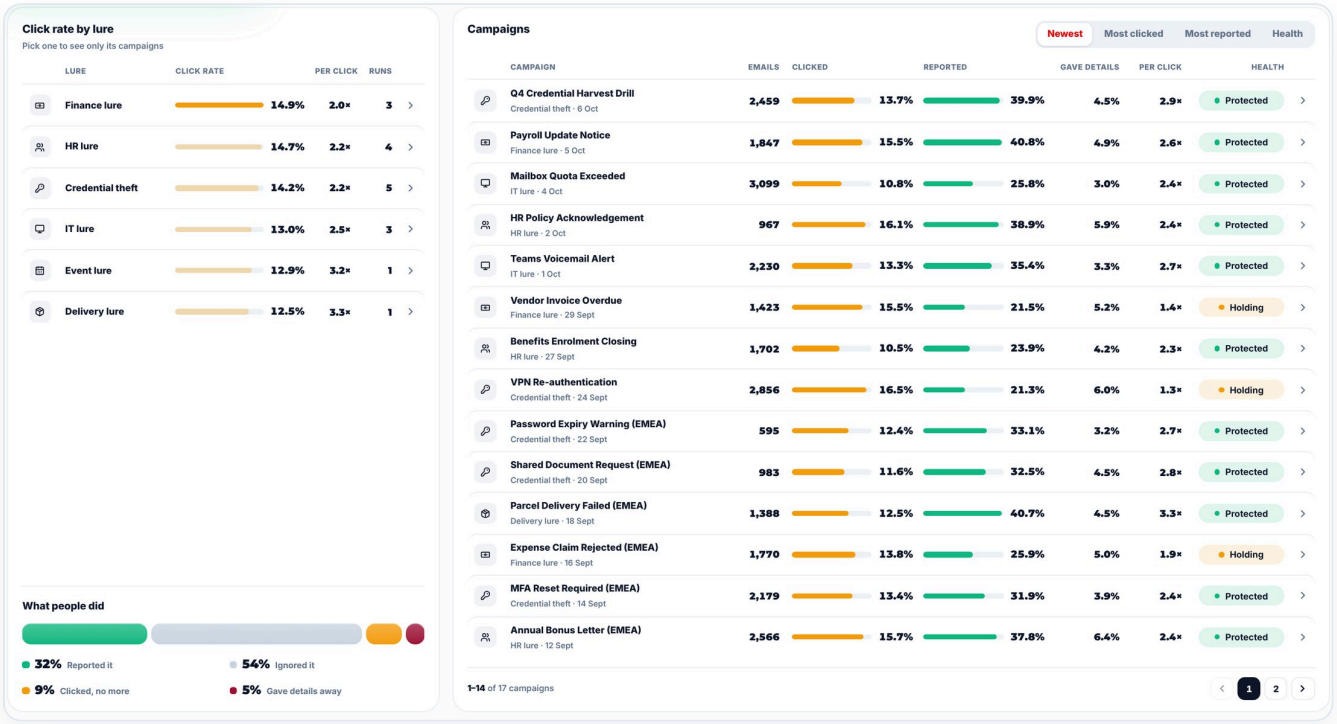

DECISIONS IT SUPPORTS

Which departments get targeted training first, which leaders to brief, and which themes to tailor to a team. Each department's profile adds its risk against the company, month by month, and its training impact.

HOW IT HELPS

Lures & campaigns: what fools people

A lure is the kind of phishing email, such as a fake invoice, an HR notice or a password reset. This tab ranks the lures and lists every campaign in one sortable table.

Lures ranked by click rate on the left; every campaign on the right, sortable and paged.

Click rate by lure

Every lure, most convincing first, with reports per click and the number of campaigns. Picking a lure shows only its campaigns, and "What people did" for that lure.

A campaign's profile

What people did, the campaign against the period's average, how fast the first reports came in, and each department's clicks and reports.

Campaigns

Emails delivered, clicked, reported, gave details, reports per click and health for each campaign. Sort by newest, most clicked, most reported or health (worst first).

A lure's profile

The lure against all the others, the departments it fooled most, and its campaigns.

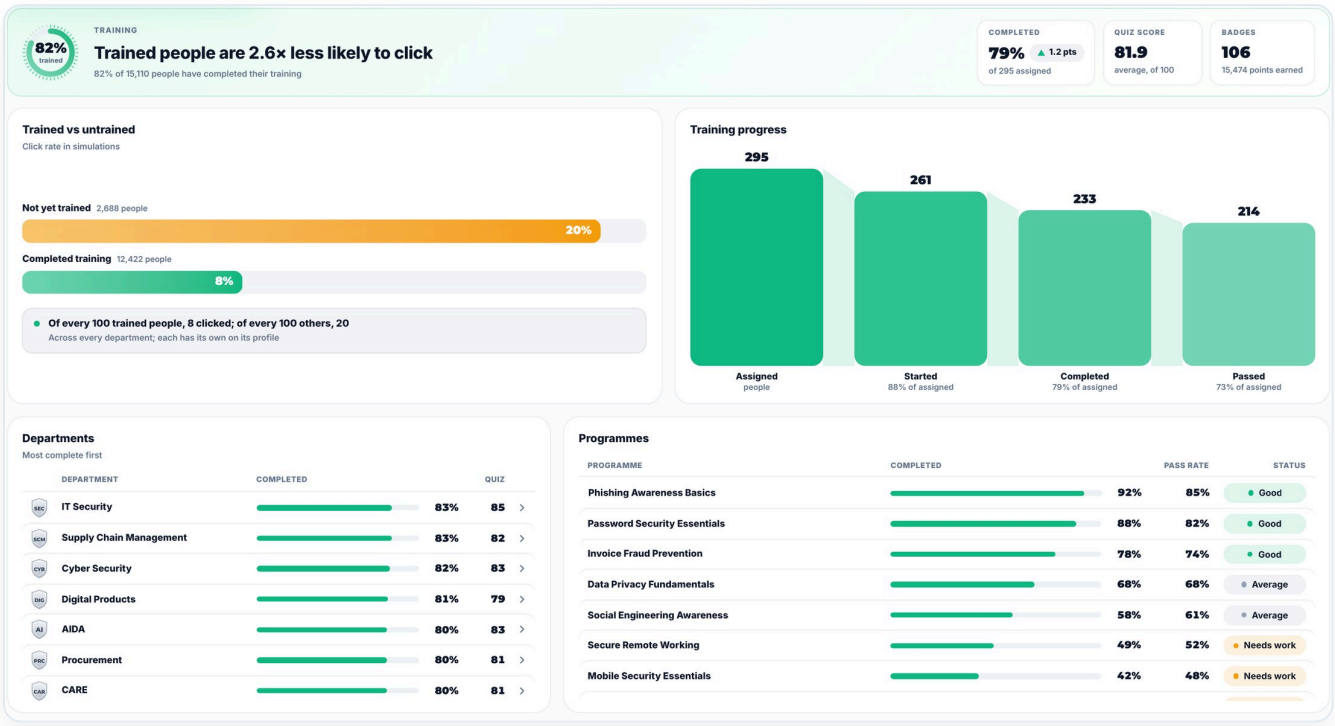

DECISIONS IT SUPPORTS

Which themes to rehearse next, which campaigns to repeat or retire, and whether a campaign's result needs a follow-up with a particular department.

HOW IT HELPS

Training: is it changing behaviour?

The Training tab measures training by its effect, not only by completion: do trained people click less, and where is training falling behind?

Training tab: the headline, trained against untrained, progress, departments and programmes.

Trained vs untrained

The click rate of people who finished training against those who have not. In the sample, 8 of every 100 trained people clicked against 20 of every 100 others.

Training progress

From assigned to started, completed and passed, so it is clear where people drop out.

Departments

Completion and average quiz score for each department, most complete first.

Programmes

Each course's completion and pass rate, marked Good, Average or Needs work.

DECISIONS IT SUPPORTS

Whether training is worth its time (the trained/untrained gap), which programmes to refresh, and which departments need a nudge to finish.

DECIDE

From what you see to what you decide

Common signals on the page, what they usually mean, and the decisions they open up. These are starting points for a conversation, not rules.

IF YOU SEE	IT USUALLY MEANS	DECISIONS TO CONSIDER	WHO
Health turns to ● Holding **or** ● Not protected	Reports are no longer keeping up with clicks	Find the campaigns that turned; remind people how to report; plan a follow-up simulation	Admins; GMT informed
The risk score stops falling, or rises two months running	The programme has stalled	Review campaign rhythm and content; agree targets with leaders	GMT, leadership
A department's high-risk share is well above the company's	Risk is concentrated in one area	Targeted training for that department; its leader follows up	Department head, admins
One lure tops the ranking across many departments	A theme people do not yet recognise	Make it the focus of the next training module and simulations	Admins
A department is deep amber on one lure only	A weakness tied to that team's work	A scenario tailored to that team	Admins, department head
Repeat clickers or "never reported" grow in Risk drivers	A small group drives much of the risk	Coaching for that group rather than more mass campaigns	Admins, line managers
The gap between trained and untrained narrows	Training is no longer changing behaviour	Refresh the content or format of the programme	Admins
"Gave details away" rises	Clicks are turning into real compromise	Teach people to spot fake sign-in pages; review safeguards such as multi-factor sign-in	GMT, security
A programme is marked Needs work	Low completion or pass rate	Deadlines, manager reminders, or a shorter course	Leadership, admins

REPORTING UPWARD

Export → Full report gives an Excel workbook: a summary with how each measure is worked out, what stands out, lures, campaigns, the trend fortnight by fortnight and month by month, people and risk, departments and training. Export → Copy a summary gives a few lines ready for an email or a slide.

HOW

How it works, and why it can be trusted

Insights adds no new data collection. It reads what the platform already records, works the numbers out the same way every time, and shows them by company, department, lure and campaign.

Phishing simulations

Emails sent, delivered, opened, clicked, reported, details given away

People's risk levels

Each person's level from their own record

Training

Assigned, started, completed, passed, quiz scores

→

Insights service

Adds results up by period, department and lure, compares each period with the one before, and works out the score, rates and health.

→

Insights page

The top band, four tabs and a profile behind every chart. Excel export and a short summary.

→

Decisions

GMT, leadership and administrators.

Built to be trusted

Privacy by design

The page shows totals for the company, departments, lures and campaigns. People-level lists are one step further and only for those with access.

No secrets stored

The practice page people land on does not ask for passwords, codes or card details. "Gave details away" counts only that it happened; the platform's rules forbid storing what anyone types, in the database or in logs.

Consistent and explained

Every measure is worked out one way across the page and the export, and the export lists how each one is calculated.

Safe to test

Simulations can only reach approved test addresses outside production, so nobody is emailed by mistake while the platform is being set up.

Where it stands today

- Complete in design; runs on a built-in sample organisation of about 15,000 people in 16 departments
- Light and dark themes; laptop to large monitor
- Next: connecting it to live campaign, reporting and training data
- Planned: sign-in with company accounts
